INSTALLATION

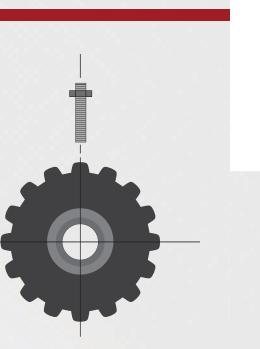

Magnetic Speed Pickup Installation:

- 1. If no mounting location is available, then drill and tap a hole in the flywheel housing. The threaded hole should be perpendicular to the center line of the crankshaft and centered over the ring gear teeth. Spot face the hole to provide a flat surface on which to anchor the locknut (refer to the charts on the inner page for the thread size of the Magnetic Speed Pickup).
- 2. Insert the magnetic speed pickup into the hole and turn it until the magnetic speed pickup makes contact with the face of the gear.
- 3. Back out the magnetic pickup by turning it counter clockwise (about a 3/4 turn). The gap between the pickup and gear should be no smaller than 0.025 in (0.64 mm) and 0.035 in (0.89 mm)

4. Wire leads should be twisted for their entire length from the magnetic speed sensor to the control unit. Shielding is required if external interference is present or the leads are longer than 10 ft (3 m).

0.035 in (0.89 mm) maximum gap

GAC's Magnetic Speed Sensors are a rugged and economic solution for detecting engine speed. Sturdier than plastic sensors and outperforming semiconductor-type devices at high temperatures, GAC's epoxy encapsulated sensors are unaffected by dust and dirt. Multiple sizes and customizable configurations are available.

- Produces Electrical Frequency
- **Requires No Energizing Circuit From Control**
- Used On All GAC's Electronic Speed Controllers

OPTIONS

TSE050 A New Tool For Your Toolkit!

The TSE050 simulates a running engine when connected to the magnetic pickup input on a speed control. An on-board potentiometer allows the signal to be adjusted between 750 to 10,000 Hz and is compatible with all GAC speed controls using a magnetic pickup.
